

Web Applications – Exam #2 (deadline 2025-07-06 at 23:59)

“Restaurant”

Question and answers already given in the google doc

1. Does the need for mozzarella also imply the need for olives (since mozzarella require tomatoes and tomatoes need olives)?

Yes, in the end it is so. However it is not listed as an explicit requirement in the database.

2. In a single order, can a user purchase only one dish (base dish + ingredients) or can he include multiple dishes in the same order?

Only one dish is required

3. We can suppose that the restaurant checks is performed by the backend?

Where to perform the checks needs to be decided by you and it is subject to evaluation. However in this specific part of the text the "order is submitted to the restaurant", so the restaurant can be considered to be the server.

4. Should orders directly display all information or should this be more like an index?

This is up to you, however if just an index is shown, then it must be possible to show the details for each entry.
